The Honorable Nita Lowey
2365 Rayburn House Office Building
Washington, D.C. 20515

Dear Chairmen Cochran and Frelinghuysen and Ranking Members Leahy and Lowey,

Accelerating innovation and increasing American competitiveness are two goals that have always enjoyed broad-based support. This consensus has been sustained by an understanding that innovation has been a driving force behind American prosperity for decades. As Congress deliberates how to balance competing priorities during the FY 2018 budget and appropriations process, it is our hope that the budget resolution and subsequent allocations enable the Energy and Water Appropriations Subcommittees to invest in America's economic and energy future by funding vital programs in energy research and development at the Department of Energy (DOE).

The successful development of new energy technologies - and the jobs they create - depends on effective partnerships between the public and private sectors. A significant component of those partnerships is the proper alignment of investments along the technology development process. Leveraging its expertise, the private sector has invested billions of dollars to commercialize new energy technologies. Critical to this process is the feedstock supplied by federal investments, especially in early-stage and high-risk research. The capital intensity of energy projects, long time horizons and uncertain regulatory environments make these partnerships especially critical in the energy sector. Such collaborations - like the development of technologies which enabled the emergence of hydraulic fracturing - have repeatedly shown their potential to enhance our energy security and create new jobs in an increasingly competitive global marketplace.

More than a billion people around the globe currently lack access to modern energy services. As populations grow over the next several decades, billions more will need access to clean, affordable and reliable energy. Federal investments at crucial stages in the innovation cycle provide essential support to private sector efforts in developing energy technologies and resources we can export to meet these needs. At the same time, such innovations also enhance the competitiveness of energy intensive domestic industries like manufacturing and agriculture, while driving down transportation costs that affect the broader economy. Importantly, programs like ARPA-E provide a blueprint for smart federal investments in high risk, high reward

technologies that boost our competitiveness by keeping America at the forefront of global energy technology research.

We commend the Committee for its long-standing commitment to support programs vital to American prosperity. Because we share your faith in American ingenuity, we encourage you to enable the Energy and Water Appropriations Subcommittees to help deliver the benefits that energy innovation has consistently provided for U.S. economic and energy security. Continued support for investments in energy research programs across DOE can accelerate innovation and secure America's competitive advantage at this critical moment for our energy and economic future.

Respectfully,
